1 Introduction

CIMA+ was retained by the proponent of the rezoning of a portion of an (draft) approved subdivision located at 0 Fieldstone Drive, Sudbury, Ontario. The aim is to rezone the lands from the existing low density residential land R1-5 to high density residential R4 to permit the development of mid-rise buildings. The proposed residential development includes three nine-storey multiple dwellings with each building containing a maximum of 108 residential dwellings units for a total of 324 dwelling units as shown in **Figure 1**.

Following the requirements of the City, an alternative scenario was considered as part of the Traffic Impact Study (TIS) where the traffic generated by 70 residential units (single detached) will replace the traffic generated by the three proposed buildings.

The study objective is to determine the traffic volumes anticipated to be generated by the proposed development during the AM and PM peak hours, and to assess the impact of this traffic on existing roadway network and recommend changes to accommodate the projected traffic if needed.

The content of this TIS follows the approach and methodology presented in the Terms of Reference (TOR) submitted to the City of Greater Sudbury (the City) for review on June 8th, 2023, and approval by the city on July 7th, 2023. **Appendix A** contains the TOR documentation.

For the context of this study, the roundabout of Sunrise Ride and North Field Crescent/Kingsview will serve as the site access with all site traffic for the three proposed buildings passing through to enter the road network. As per the TOR, the roundabout was not part of the operational analysis.

0 Fieldstone Drive Subdivision Plan

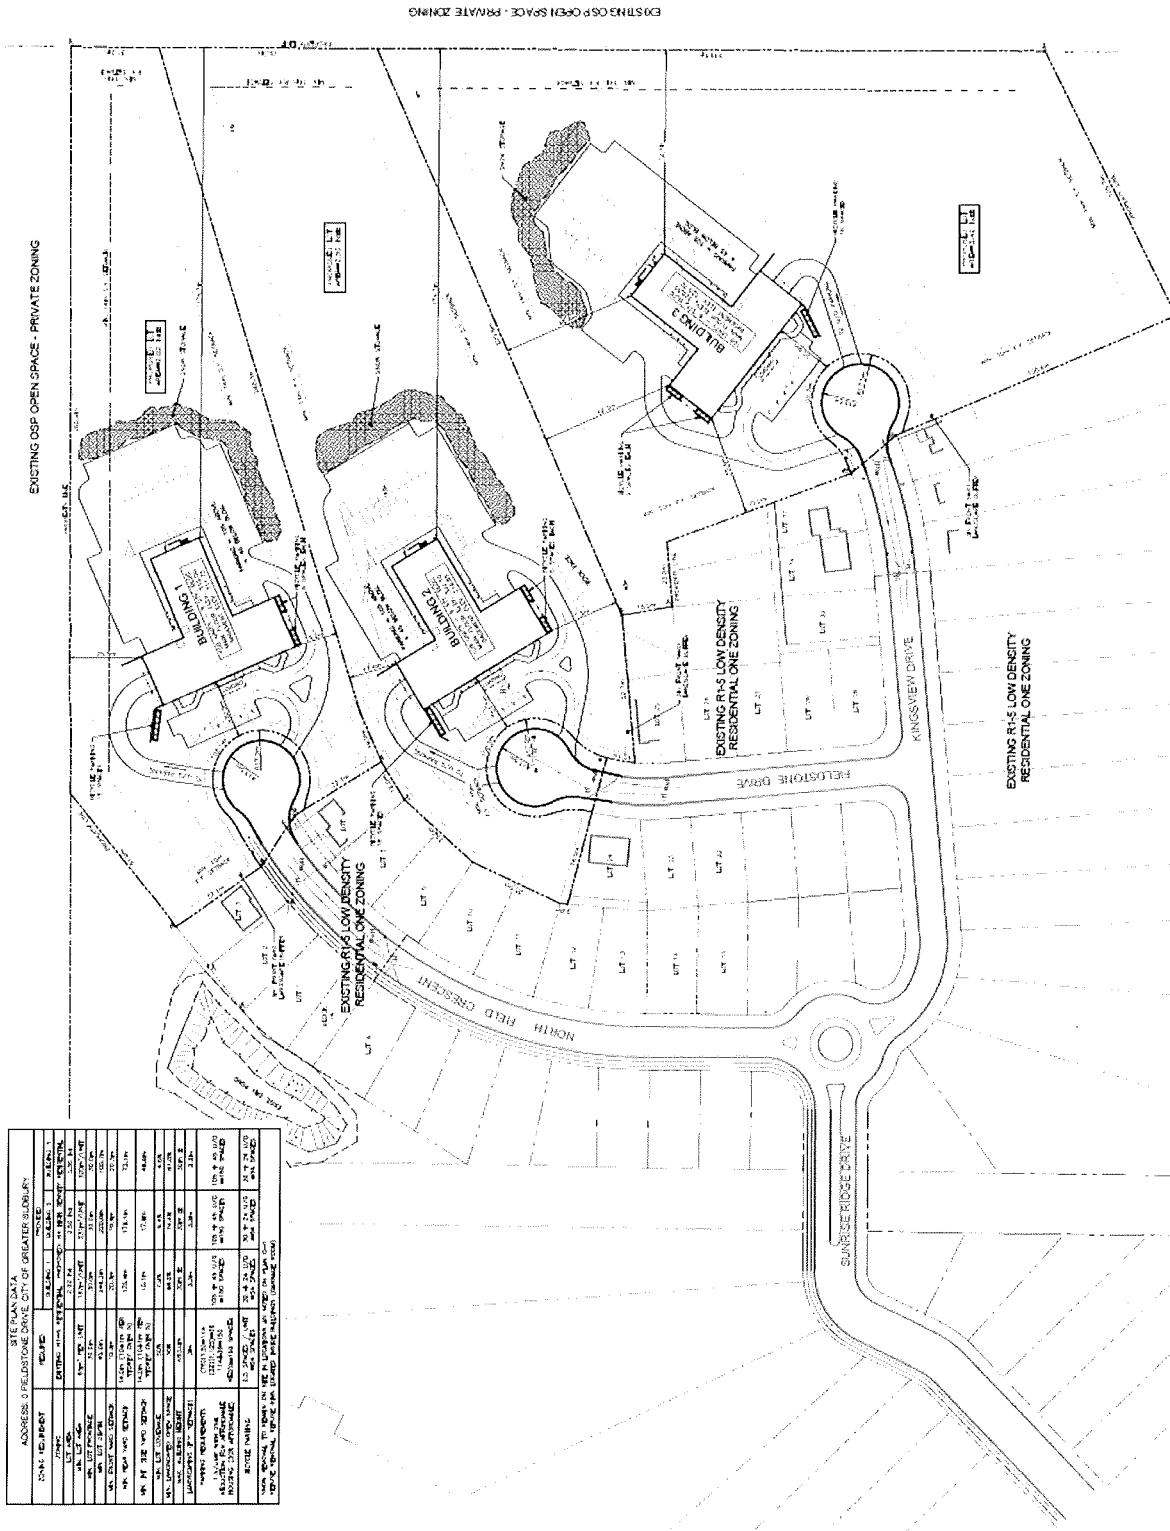

Figure 1: Proposed Development - 0 Fieldstone Drive

1.1 Study Area

Figure 2 illustrates the subject site along with the surroundings lands, which together, represents the study area. The study area is bounded by arterial roads Kingsway/Lloyd Street and Notre Dame Street. Both these arterial roads lead to the downtown core to the southwest of the development. The proximity of the development site to the Downtown Sudbury Area is approximately one kilometre.

The land use nearby the development site consists of a mixture of low, medium, and high-density residential units consisting of single detached homes, townhouses, and apartment buildings. Along Mont Adam Street there are apartments and co-op homes, while Notre Dame Avenue has commercial avenues, residential homes, and a secondary school.

Figure 2: Study Area and Study Intersections

The following intersections were analyzed as part of the road network effected by the development:

- Mont Adam Street at Sunrise Ridge (stop control minor road)
- Mont Adam Street at Montebello Street/Cochrane Street (stop control minor road)
- Mont Adam Street at Mountain Street (all-way stop)
- Mont Adam Street at Lloyd Street (stop control minor road/ RIRO)
- Cochrane Street at Kingsway (Signalized)
- Leslie Street at Notre Dame Avenue (Signalized)

The traffic counts were conducted by Ontario Traffic Inc. (OTI) on Wednesday August 30, 2023, for the following intersections:

- Mont Adam Street at Sunrise Ridge.
- Mont Adam Street at Montebello Street/Cochrane Street.
- Mont Adam Street at Mountain Street, and
- Mont Adam Street at Lloyd Street.

The traffic counts provided by the City, for Cochrane Street at Kingsway, and Leslie Street at Notre Dame Avenue, were conducted in 2022 and grown to 2023 with a compounded growth rate of 1.5% per annum. Signal timing plans were provided by the City.

A copy of the existing traffic counts and signal timing plans are provided in **Appendix B**.

1.2 Study Methodology

This study evaluates existing and future traffic operations at study area intersections for the weekday AM peak period (7:00-9:00), and weekday PM peak period (16:00-18:00), as this time periods was confirmed by the City.

The study assessed traffic operations under existing (2023) conditions and the following future horizon years:

- Future (2028) Background Conditions (5-year horizon¹); and,
- Future (2028) Total Conditions (5-year horizon).

Intersection operations were assessed using the Synchro 11 software which utilizes the Highway Capacity Manual (HCM) 2000 methodology published by the Transportation Research Board National Research Council. Synchro 11 can analyze both signalized and unsignalized intersections in a road corridor or network considering the spacing,

¹ Future horizon of 5 years from the date of the TIS.

interaction, queues, and operations between intersections. Intersection operations performance metrics are reported in terms of Level of Service (LOS), volume to capacity (v/c) ratios.

Level of Service is based on the average control delay per vehicle for a given movement. Delay is an indicator of how long a vehicle must wait to complete a movement and is represented by a letter between 'A' and 'F', with 'F' being the longest delay.

Table 1 summarizes the LOS criteria for signalized and unsignalized intersections.

Table 1: Intersection Level of Service Criteria

Level of Service	Average Control Delay per Vehicle (second/vehicle)	
	Signalized Intersection	Unsignalized Intersection
A	≤ 10	≤ 10
B	$> 10 \text{ and } \leq 20$	$> 10 \text{ and } \leq 15$
C	$> 20 \text{ and } \leq 35$	$> 15 \text{ and } \leq 25$
D	$> 35 \text{ and } \leq 55$	$> 25 \text{ and } \leq 35$
E	$> 55 \text{ and } \leq 80$	$> 35 \text{ and } \leq 50$
F	> 80	> 50

SimTraffic software was used to calculate the 95th percentile queue length to analyze and assess the available storage capacity and whether queue spillback or lane blockages occur due to long queues. The available storage capacity was based on the best available data collected from aerial imagery.

The city is currently updating its Traffic Impact Study Guidelines. Therefore, for this study, critical intersections are established based on the following criteria:

- Level of Service of E or worse;
- Volume to Capacity ratio of 1.00; and
- 95%th queue exceeds the available storage length.

It should be noted that the peak hour factor (PHF) was calculated from the provided TMCs. The calculated PHF was used for all existing and future scenarios.

This report presents the analysis of the following two scenarios:

- **Scenario 1** which includes 70 Single Family Detached Housing; and
- **Scenario 2** which includes 324 Residential units in Multifamily Housing (Three Midrise Buildings).

Scenario 1 considers the effects of the 70 single detached residential units as part of the original zoning plan, which includes Phases 1 and 2. Whereas **Scenario 2** considers the effects of the three new midrise buildings (replaces the 70 total single detached residential units). Therefore, for Scenario 2, only the traffic generated by the three new midrise buildings is considered development driven.

The purpose of analyzing the following two scenarios is to showcase the differences between single detached residential houses and mid-rise buildings.

2 Existing Traffic Operations

The following section outlines existing conditions. Existing intersection operations were analyzed using the lane configurations illustrated in **Figure 3**.

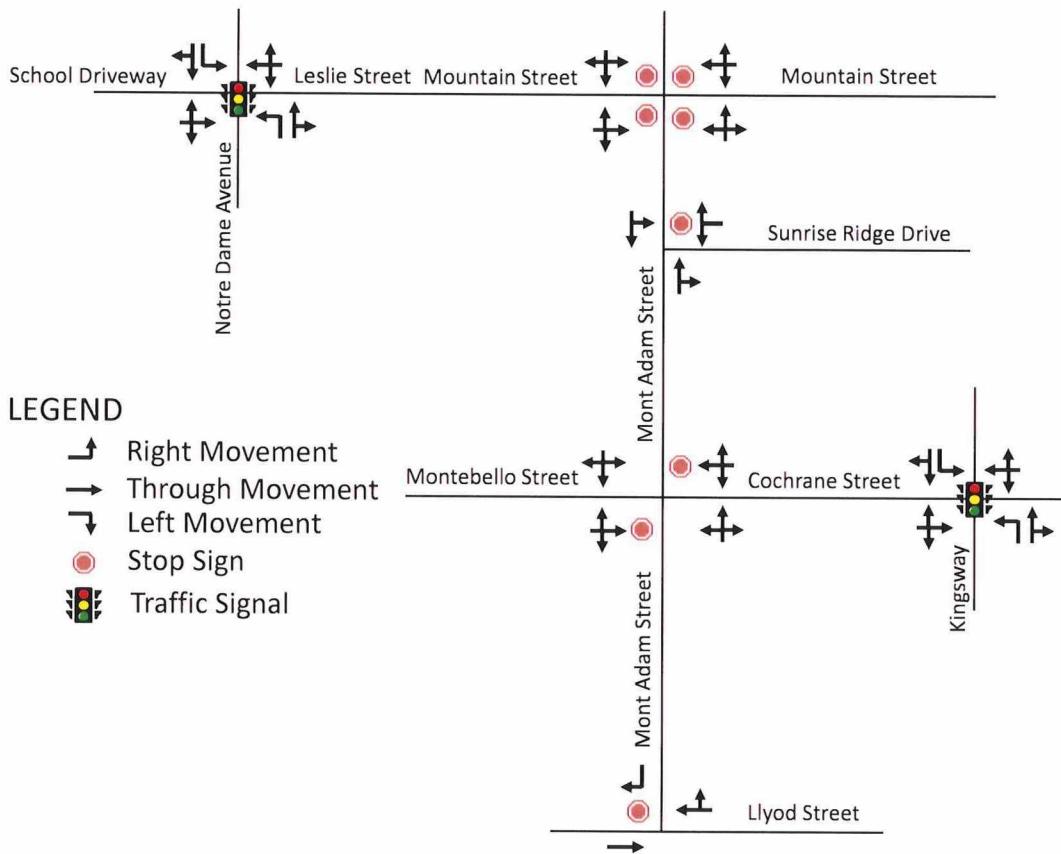

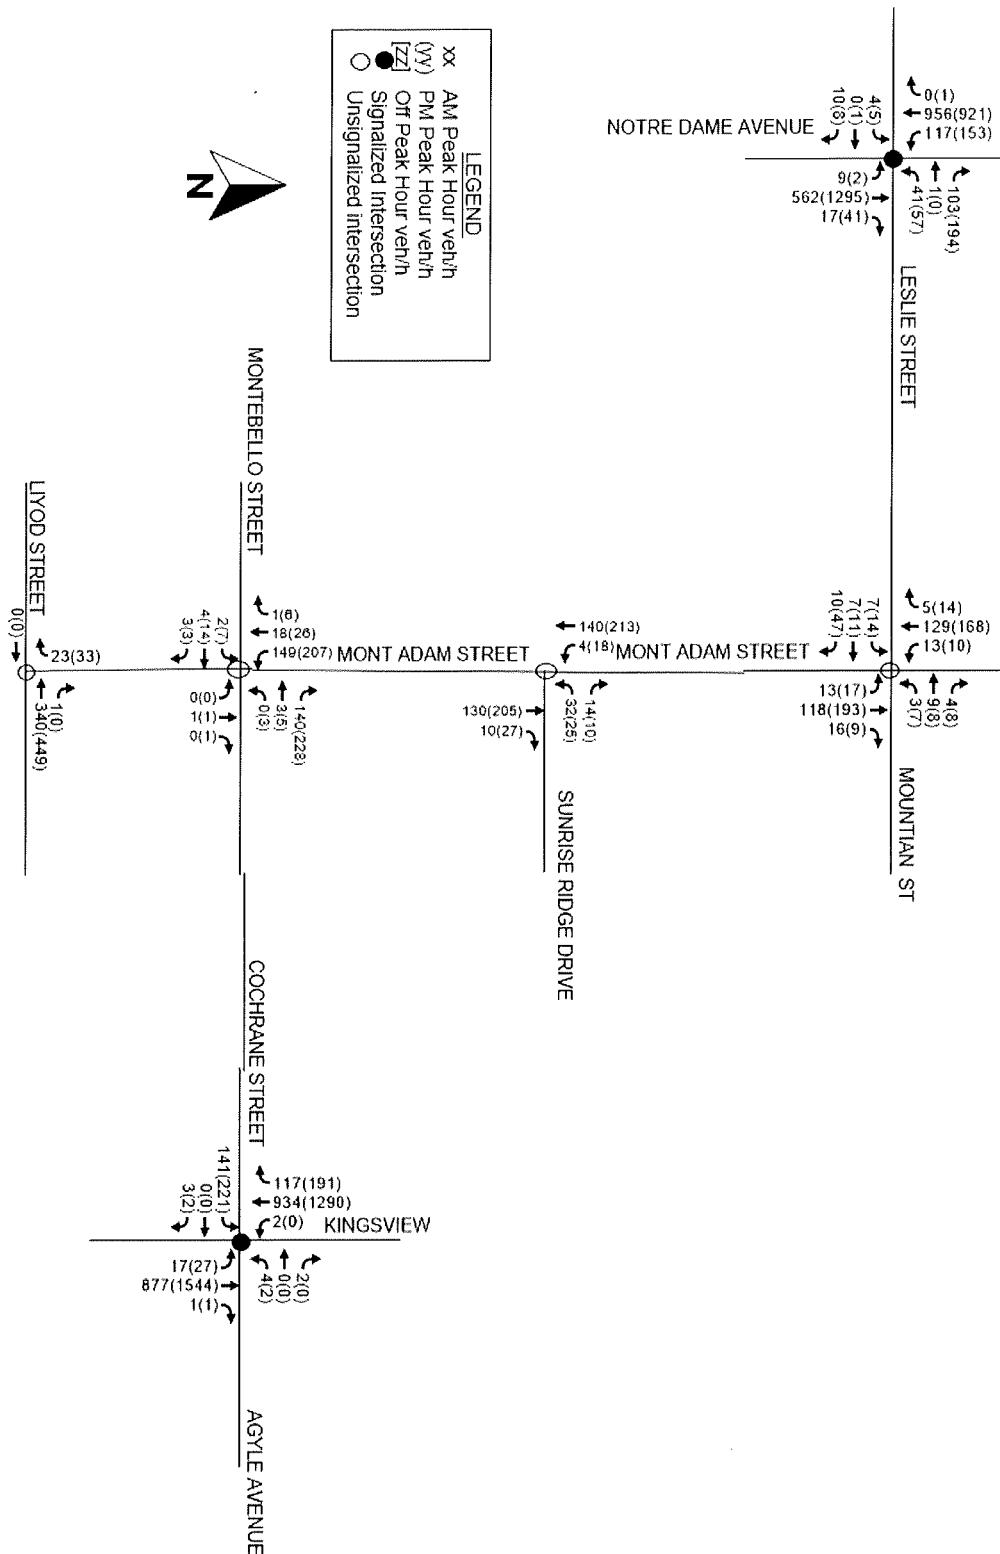

Figure 3: Existing Lane Configuration

2.1 Existing Traffic Volumes and Operations

As previously mentioned in Section 1.1, CIMA+ received the collection of turning movement counts (TMC) for the study area network from a combination of OTI and the City.

The counts reveal that the AM peak hours vary between 07:30 to 08:30 AM, 07:45 to 08:45 AM, 08:00 to 09:00 AM. While the PM peak hours vary between 16:30 to 17:30, 16:00 to 17:00, and 16:15 to 17:15 PM. The TMCs provided by the City for Cochrane Street at Kingsway, and Leslie Street at Notre Dame Avenue, were conducted in 2022 and grown to 2023 with a growth rate of 1.5%. The resulting existing traffic volumes are shown in **Figure 4**.

Figure 4: Existing 2023 Volume

Traffic operations were reviewed using Synchro 11 and SimTraffic software. Volume to capacity ratio (v/c), level of service (LOS) and delay, and 95th percentile queues were reviewed. The results are summarized in **Table 2**. Synchro outputs are available in **Appendix C**.

It should be noted that the available storage capacity is based on aerial imagery to measure storage lane length or distance from the subject intersection to the nearest upstream traffic-controlled intersection.

Legend: AM (PM)

All movements are operating at an acceptable level of service. All 95th percentile queues can be accommodated within existing storage capacity².

Additionally, the Kingsway at Cochrane Street/Argyle Avenue intersection experiences southbound queues that extend past the upstream, stop-controlled Kitchener Avenue intersection during the PM peak hour.

2.2 Active Transportation

2.2.1 Pedestrian and Cyclist Infrastructure

Sidewalks are provided on one side alongside most streets in the study area. Existing sidewalks are illustrated in **Figure 5**. There are no dedicated bike lanes within the study area road network and cyclists need to share the road with vehicular traffic.

² Except for the southbound left-turn queue at Notre Dame Avenue at Leslie Street/Driveway intersection, which extends approximately two car lengths beyond the available storage.

Figure 5: Existing Sidewalks

2.2.2 Transit Services

The subject site is well served by public transit provided by GOVA Transit. The bus route within the study area is Route 27 which operates on weekdays and weekends with service headway of sixty (60) minutes. There are three bus stops along Mont Adam Street on the south side and one bus stop located on Cochrane Street. The closest stop is 100m north of Mont Adam Street and Sunrise Ridge Drive, which is approximately 700 metres from the subject site. Route 2 and Route 12 have stops on Lloyd Street and Mont Adam Street, which is approximately 1100 meters from the subject site.

2.3 Collision Report

A collision analysis was conducted to identify any potential safety issues within the study area. The most recent five years' worth of historical collision data was provided by

the City. The provided collision data is dated between 2018 and 2023. The collision analysis data is provided in **Appendix D**.

During the 5-year analysis period, there were a total of 120 collisions within the study area. There were 19 collisions that caused property damage only (PDO), eight collisions that caused non-fatal injuries and ninety-four non-reportable collisions. The collisions were contrasted against the 2019 Ontario Road Safety Annual Report (ORSAR) results, which was used as a baseline for comparison.

The collision data was further examined for patterns that might point to underlying safety issues. The following collision characteristics were reviewed to find possible collision patterns:

- Severity;
- Prevailing Driver Action;
- Prevailing Impact Type;
- Lighting; and
- Road Surface Conditions.

Table 3 summarizes the collision by prevailing driver action, impact type, and environmental conditions.

Table 3: Collision Type and Prevailing Conditions

Prevailing Driver Action	Prevailing Impact Type	Lighting		Surface Condition		
		Daylight	Non-Daylight	Clear	Rain	Snow
28 % Driving Properly	39% Rear End	88	32	100	4	16

Out of the 120 collisions, thirty-three drivers were driving properly, sixteen lost controls, twenty-seven were following too close, six failed to yield right of way, five improper lane changes, six were too fast for conditions, three exceeded the speed limit, five disobeyed traffic controls were driving properly, one driver did an improper turn, and nine was noted as being at fault for other unspecified reasons. The prevailing impact type was rear end collisions.

Location

Majority of intersection occur at Cochrane at Kingsway (31/120), Kingsway between Cochrane Street and Fabbro Street (30/120), and at Leslie Street at Notre Dame Avenue (27/120). This makes sense as these are classified as arterial roads, and the remaining are local roads.

Light Condition

32 out of 120 collisions (27%) occurred during non-daylight conditions. This statistic is right around the 27.9% (dusk, dawn, and darkness) reported in the 2019 Ontario Road Safety Annual Report (ORSAR). The illumination seems not to have contributed to collisions. Majority of the non-daylight accidents (14/32=44%) occurred on Kingsway between Cochrane Street and Fabbro Street.

Road Surface Condition

100 out of 120 (84% of collisions) occurred on clear road conditions. There are three wet surface collisions ($3/120=2.5\%$), this is lower than the 2019 ORSAR wet conditions are reported in 15.6% scenarios. The proportion of loose snow surface collisions ($1/120$) is lower than the 5.2% reported in the 2019 ORSAR. The proportion of packed snow surface collisions ($15/120=12.5\%$) is higher than the 3.3% reported in the 2019 ORSAR.

Prevailing Impact

The prevailing impact type was rear end collisions (46/120). 46% (21/46) of rear end collisions happen at Cochrane at Kingsway. The prevalent driver condition being them following too closely ($27/46=59\%$). Most rear end collisions occurred during Clear ($42/46=91\%$) conditions. The light condition during these collisions where most frequently daylight conditions ($39/46=85\%$).

3 Future Background Conditions

Future traffic volumes were estimated using a compound annual growth rate of 1.5% for the five-year horizon year (2028). Background developments were accounted with the growth rate provided by the City.

3.1 Future Traffic Growth

Future background traffic consists of two components: traffic growth outside the study area and other development site traffic within the study area. There were no background developments considered in this study. A compound growth rate of 1.5% per annum was used in the analysis to estimate future traffic volumes.

3.2 2028 Traffic Volume and Operations

The future 2028 traffic volumes are shown in **Figure 6**.

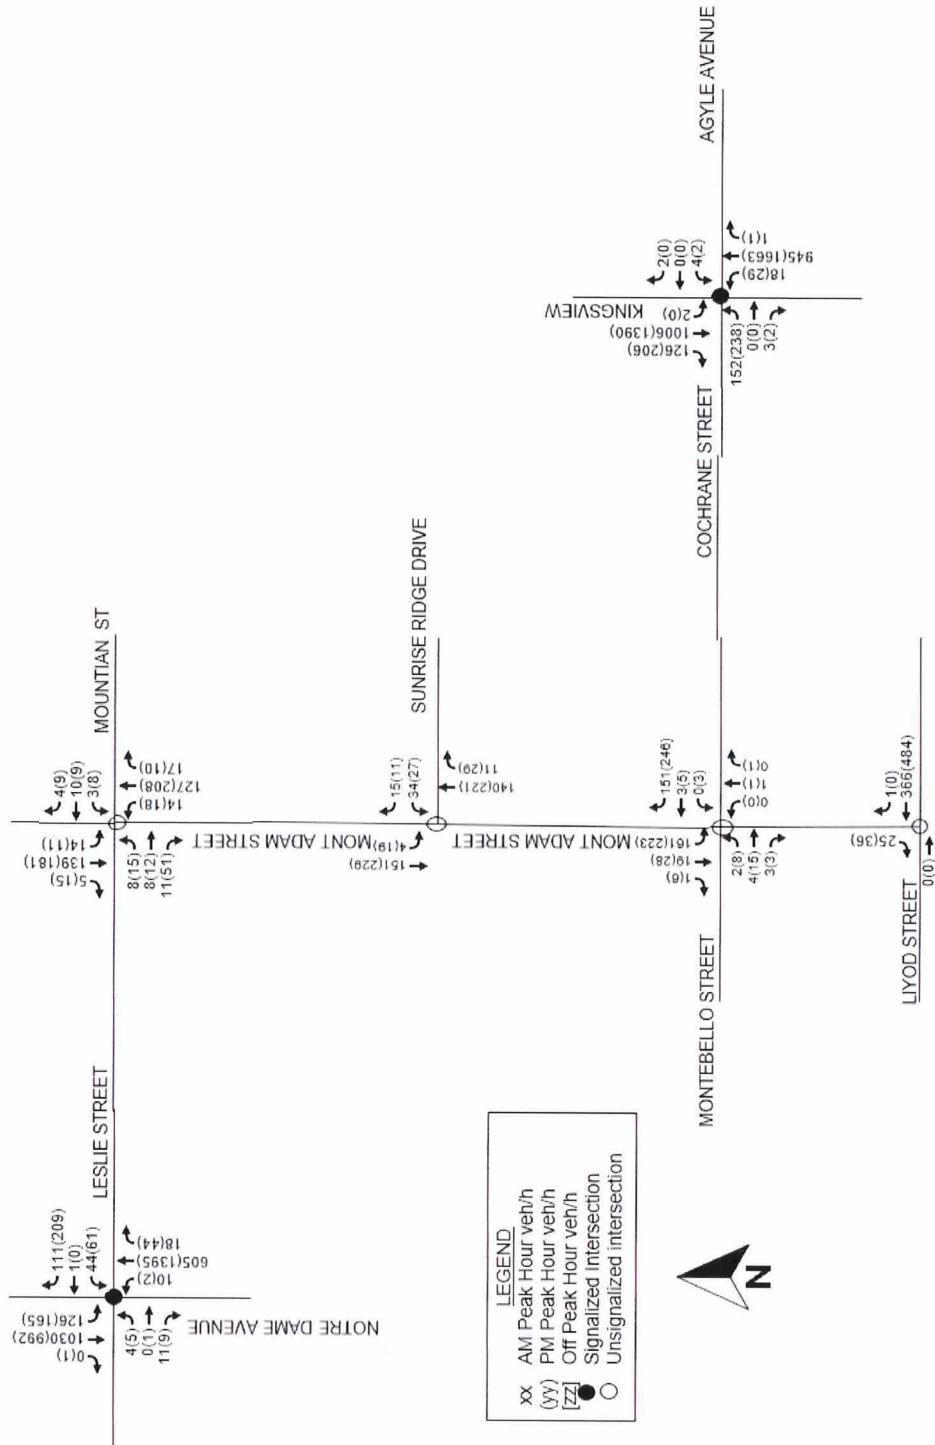

Figure 6: Future Background 2028 Volume

Traffic operations were reviewed using Synchro 11 and SimTraffic software. Volume to capacity ratio (v/c), level of service (LOS) and delay, and 95th percentile queues were reviewed. The results are summarized in **Table 4**. Synchro and SimTraffic outputs are available in **Appendix E**.

Legend: AM (PM)

All movements are expected to operate at an acceptable level of service. Assessing the 95th percentile queue indicates that there is adequate storage for all movements except for the following two intersection movements:

- Kingsway at Cochrane Street/Argyle Avenue - Northbound left is half-a-car length beyond available storage during the PM peak hour.
- Notre Dame Avenue at Leslie Street/Driveway - Southbound left is half-a-car length beyond available storage during the PM peak hour.

Additionally, the Kingsway at Cochrane Street/Argyle Avenue intersection is expected to experience southbound queues that extend past the upstream, stop-controlled Kitchener Avenue intersection during the PM peak hour.

4 Future Total Conditions

4.1 Trip Generation

The number of vehicle trips to be generated by the development and rezoning of the approved subdivision located at 0 Fieldstone Drive for the weekday AM and weekday PM peak hours has been determined based on type of use, residential units, and trip generation rates as per the ITE Trip Generation Manual 11th edition.

The following two Scenarios are analyzed in this report:

- Scenario 1 which includes 70 Single Family Detached Housing; and
- Scenario 2 which includes 324 Residential units in Multifamily Housing (Three Midrise Buildings)³.

All Trip rates are based on the respective peak hour generators fitted curved. It was assumed that all trips generated by the proposed site will consist of auto trips (i.e., a conservative approach)⁴. The projected trip generation for the proposed development during the weekday AM and weekday PM peak hours are summarized in **Table 6** and **Table 5**.

4.1.1 Scenario 1 – 70 Single Family Homes

Table 5: Trip Generation Summary for Scenario 1

ITE Land Use	Units	Parameter	AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
Single Family Detached Housing	70	Equation	$T=0.71(x)+7.23$			$\ln(T) = 0.93 \ln(x)+0.36$		
		Gross Trips	15	42	57	48	27	75
		Non-Auto (0%)	-	-	-	-	-	-

³ ITE Trip Generation 11th Edition Manual describes a mid-rise (LUC 221) as a building that has between four and ten floors of living space.

⁴ The Institute of Transportation Engineers (ITE), trip generation factors are based on data collected from various land use types across different locations and time periods. The data include the number of trips, the trip purpose, the trip length, the mode of travel, and other variables that affect trip making behavior. The data are then analyzed and summarized to produce average trip rates, equations, or curves that relate trip generation to the independent variable (such as floor area, number of employees, etc.) for each land use type. The trip generation factors are updated periodically to reflect changes in travel patterns and land use characteristics.

(ITE LU Code 210)								
		Total Trips	15	42	57	48	27	75

As detailed in **Table 5**, the proposed development in Scenario 1 is expected to generate 57 new auto trips during the weekday AM peak hour (15 trips in / 42 trips out) and 75 new auto trips during the weekday PM peak hour (48 trips in / 27 trips out).

4.1.2 Scenario 2 – Three Midrise Buildings

Table 6: Trip Generation Summary for Scenario 2

ITE Land Use	Units	Parameter	AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
Multifamily Housing (Mid-Rise) (ITE LU Code 221)	324	Equation	$T=0.32(x)+5.84$			$T=0.32(x)+15.57$		
		Gross Trips	29	81	110	71	48	119
		Non-Auto (0%)	-	-	-	-	-	-
Total Trips			29	81	110	71	48	119

As detailed in **Table 6**, the proposed development in Scenario 2 is expected to generate 110 new auto trips during the weekday AM peak hour (29 trips in / 81 trips out) and 119 new auto trips during the weekday PM peak hour (71 trips in / 48 trips out).

4.2 Trip Distribution

The trip distribution for the proposed development is based on the existing travel patterns. The resulting trip distribution is summarized in **Table 7**.

Table 7: Trip Distribution Summary

From/To	Via	Inbound	Outbound
North	Notre Dame Avenue	10%	10%
South	Notre Dame Avenue	35%	35%
West	Cochrane Street	50%	50%
	Llyod Street	5%	5%
Total Trips		100%	100%

The resulting site generated trips are illustrated in **Figure 7** for Scenario 1 and **Figure 8** for Scenario 2.

4.2.1 Scenario 1 – 70 Single Family Homes

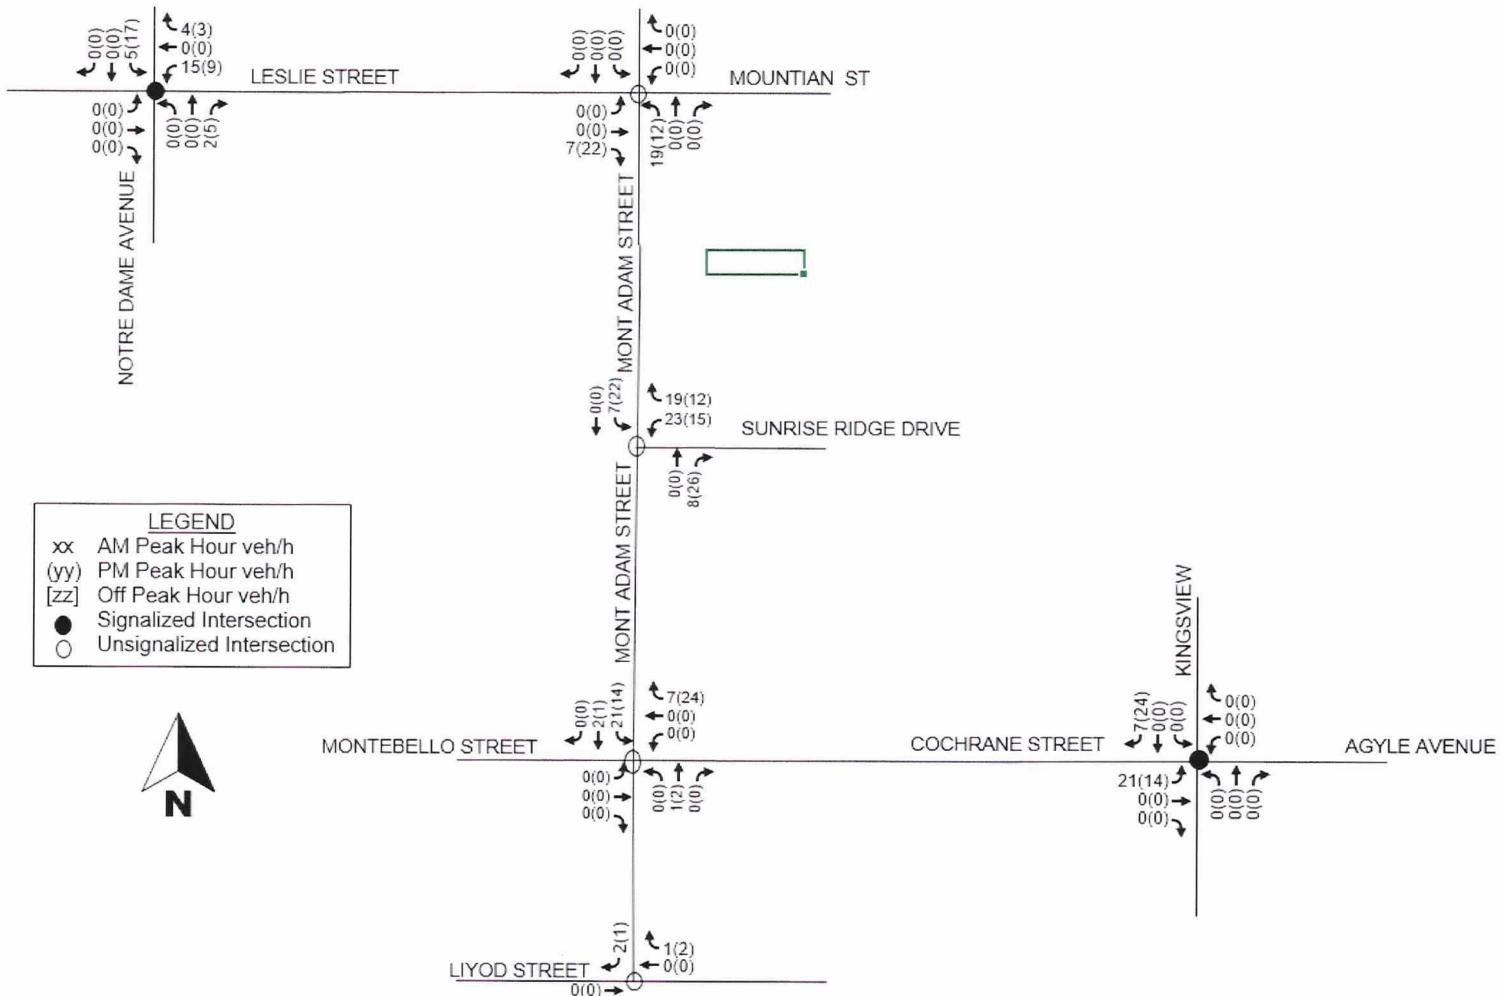

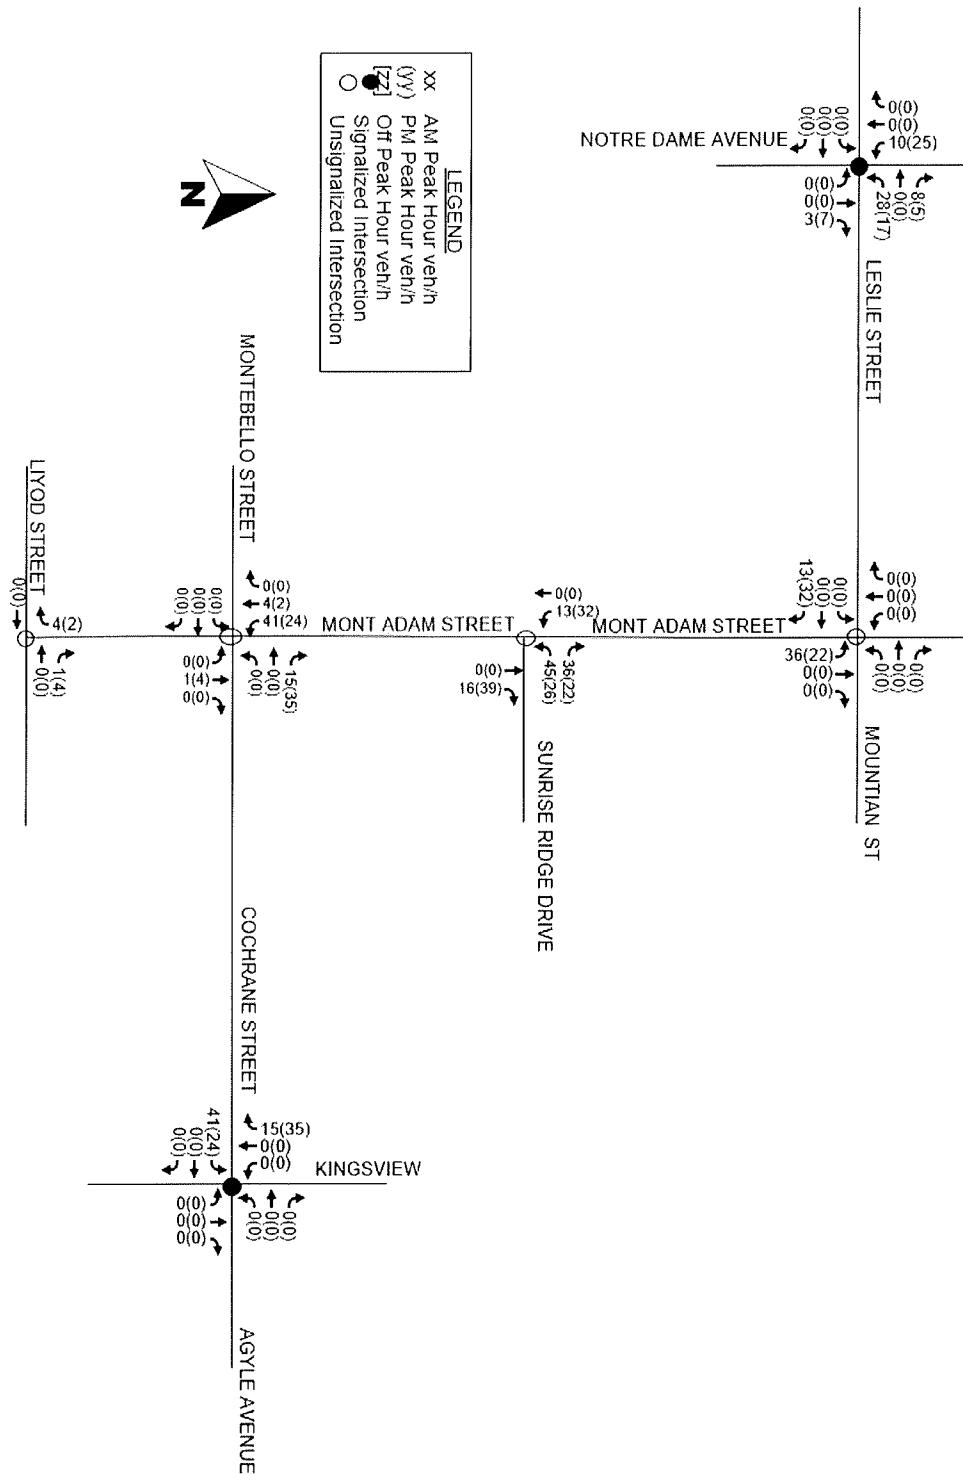

Figure 7: Scenario 1 Site Traffic

Figure 8: Scenario 2 Site Traffic

4.2.2 Scenario 2 – Three Midrise Buildings

4.3 2028 Future Total Conditions

Traffic operations under future 2028 total conditions were analyzed for the weekday AM and weekday PM peak hours. The traffic analysis and results for the future total conditions are discussed in this section.

4.3.1 Scenario 1 – 70 Single Family Homes

Future (2028) total intersection operations were assessed using the existing lane configurations. The Scenario 1 future (2028) total traffic volumes were estimated by adding the Scenario 1 site traffic (**Figure 7**) to future (2028) background volumes (**Figure 6**) and the resulting future (2028) total traffic volumes are illustrated in **Figure 9**. The analysis results are provided in **Table 8** and detailed calculations are provided in **Appendix G**.

Figure 9: Scenario 1 - Future (2028) Total Traffic Volumes

Legend: AM (PM)

All movements are expected to operate at an acceptable level of service. Assessing the 95th percentile queue indicates that there is adequate storage for all movements except for the following two intersection movements:

- Kingsway at Cochrane Street/Argyle Avenue - Northbound left is half-a-car length beyond available storage during the PM peak hour, which can be accommodated by the taper.
- Notre Dame Avenue at Leslie Street/Driveway - Southbound left is half-a-car length beyond available storage during the PM peak hour, which can be accommodated by the taper.

Additionally, similar to the future background scenario, the Kingsway at Cochrane Street/Argyle Avenue intersection is expected to experience southbound queues that extend past the Kitchener Avenue upstream intersection.

It should be noted that the traffic generated by the proposed development will have a minimal effect on the projected queuing conditions that are mostly attributable to background traffic.

4.3.1.1 Proposed Mitigations

Based on the analysis results provided in **Table 8**, no mitigation measures are required under Scenario 1 future (2028) total conditions.

4.3.2 Scenario 2 – Three Midrise Buildings

Future (2028) total intersection operations were assessed using the existing lane configurations. The Scenario 2 future (2028) total traffic volumes were estimated by adding the Scenario 2 site traffic (**Figure 8**) to future (2028) background volumes (**Figure 6**) and the resulting future (2028) total traffic volumes are illustrated in **Figure 10**. The analysis results are provided in **Table 9** and detailed calculations are provided in **Appendix F**.

Figure 10: Scenario 2 – Future (2028) Total Traffic Volumes

Legend: AM (PM)

All movements are expected to operate at an acceptable level of service. Assessing the 95th percentile queue indicates that there is adequate storage for all movements except for the following two intersection movements:

- Kingsway at Cochrane Street/Argyle Avenue - Northbound left is one car length beyond available storage during the PM peak hour, which can be accommodated by the taper.
- Notre Dame Avenue at Leslie Street/Driveway - Southbound left only one metre beyond available storage during the PM peak hour, which can be accommodated by the taper.

Additionally, similar to the future background scenario, the Kingsway at Cochrane Street/Argyle Avenue intersection is expected to experience southbound queues that extend past the Kitchener Avenue upstream intersection.

Once again, it should be noted that the traffic generated by the proposed development will have a minimal effect on the projected queuing conditions that are mostly attributable to background traffic.

4.3.2.1 Proposed Mitigations

Based on the analysis results provided in **Table 9**, no mitigation measures are required under Scenario 2 future (2028) total conditions.

5 Conclusion

Based on the analysis results, the following conclusions can be made:

- The analysis results indicate that all movements at study intersections are operating with acceptable level of service and residual capacity during the weekday AM and weekday PM peak hours under existing conditions.
- The site is expected to generate 57 new auto trips during the weekday AM peak hour and 75 new auto trips during the weekday PM peak hour for scenario 1.
- For scenario 2 the site is expected to generate 110 new auto trips during the weekday AM peak hour and 119 new auto trips during the weekday PM peak hour.
- The analysis results indicate that all movements at study intersections are expected to operate with acceptable level of service and residual capacity during the weekday AM and weekday PM peak hours under future background and both Scenario 1 and Scenario 2 future total conditions.
- No mitigation measures are required under all 2028 future scenarios.

Appendix A: Terms of Reference Documentation

June 8, 2023

Attention: Ryan Purdy, Traffic and Transportation Engineering Analyst
CC: Kevin Jarus – Tulloch, Sam Biasucci – 920936 Ontario Inc.
RE: Terms of Reference for the Preparation of a Traffic Impact Study – Zoning By-Law Amendment – 0 Fieldstone Drive

Dear Ryan

As per the requirements established in the Pre-Consultation Understanding dated January 10, 2019, we would like to present for your review and comments the following Terms of Reference for the completion of a Traffic Impact Study supporting the Zoning By-Law Amendment of 0 Fieldstone Drive. The present document summarizes our understanding of the assignment, outlines our work plan, and the need for information to support the preparation of the Study.

Background and Understanding

We were advised that 920936 Ontario Inc - a Tulloch's client, is planning the rezoning of a portion of a (draft) approved subdivision located at 0 Fieldstone Drive, in Sudbury ON (see **Figure 1**).

Figure 1 Proposed Development – 0 Fieldstone Drive

Based on information provided by Tulloch it is our understanding that the City provided to 920936 Ontario Inc., a Pre-Consultation Understanding report indicating the following requirements:

- That the owner apply to rezone the lands from "R1-5," Low Density Residential One to "R4", High Density Residential in order to permit the development of three nine-storey multiple dwellings with each building containing a maximum of 108 residential dwellings units for a total of 324 residential dwelling units.
- The submission of a Traffic Impact Study (TIS) that has been completed by a qualified professional engineer is required. The TIS must at a minimum assess the traffic impacts of the proposed development on the surrounding road system and identify any improvements to the road system or mitigating measures to that would be necessary in order to accommodate the development.
- The TIS must also consider active transportation and traffic-calming measures that would be appropriate in this particular urban residential context.

Based on our communications with Tulloch regarding the potential scope of work we also understand that:

- Only traffic generated by the new 3 buildings will be considered development driven.
- Traffic generated by the single detached residences for Phase 1, Phase 2, and the remaining units in the rezoning portion of the site plan will be considered as Background. The estimated total number of units is 124.
- The study area will have its origin in the west leg of the proposed roundabout as shown in Figure 1. The operational analysis of the roundabout is not included as part of the TIS.
- An alternative scenario will be considered as part of the TIS in which the traffic generated by 70 residential units (single detached) will replace the traffic generated by the proposed 3 buildings.

Work Plan

Task 1: Review of Background Information and Estimation of Volumes

CIMA+ will review all relevant background information related to the proposed development and estimated traffic volumes at the proposed access (Sunrise Ridge Drive). In order to complete this task, we would appreciate if the City can confirm the availability of the following information:

- Turning movement counts (TMC), historical and recent AADT volume information for the following roads:
 - Mont Adam Street and Sunrise Ridge Drive (stop control minor road)
 - Mont Adam Street and Montebello Street/Cochrane Street (stop control minor road)
 - Mont Adam Street and Mountain Street (all-way stop)
 - Mont Adam Street and Lloyd Street (RIRO)
 - Cochrane Street and Kingsway (signalized)
 - Leslie Street and Notre Dame Avenue (signalized)
- Collision records for the past 5 years;

If the City cannot provide some or any of the aforementioned information, we would appreciate if the City can confirm the time (AM and PM peaks) and periods (weekday or Saturday) that needs to be considered for data collection.

Task 2: Trip Generation, Distribution, Assignment & Traffic Control Assessment

CIMA+ will undertake trip generation calculations, distribution and assignment for the proposed development based on the information to be provided by the developer. Trip generation will be conducted using the Institute of Transportation (ITE) Trip Generation manual, 11th edition.

This assessment will include two different scenarios:

- Scenario 1 that will consider the effects of the number of single detached units included as part of the original zoning plan, and
- Scenario 2 that will consider the effects of the 3 new buildings.

CIMA+ will evaluate necessary changes to the existing control at the aforementioned intersections of Mont Adam Street, Cochrane Street and Leslie Street. Similarly, the potential effects on the existing traffic control, auxiliary lanes, and tapers at the aforementioned intersections will be identified. The traffic control assessment will consider the increased volume of traffic associated with the proposed development and the surrounding area for the future horizon of 5 years from the date of the TIS. To this purpose we would appreciate if the City can confirm the growth rate to be used for estimation of the future background traffic. Considerations for other modes of transportation will be included as part of our analysis.

Task 3: Review for Additional Roadway Improvements

CIMA+ will evaluate the need for any improvements at the aforementioned intersections in accordance with the TAC Road Design Guide, and other applicable municipal design standards.

Task 4: Prepare Draft and Final TIS Report

CIMA+ will prepare a draft report summarizing Tasks 1 through 3 that will be submitted to the City for review and comments. Any comments provided by the City will be addressed as part of the Final TIS Report.

It is assumed that the design of any necessary improvements to support the City's approval will be conducted by Tulloch.

Closing

I would like to thank you in advance for your prompt response. If we need to discuss any portion of this Terms of Reference, please let us know and I will reach to you to discuss.

Sincerely,

CIMA Canada Inc.

Jaime Garcia, P.Eng., Ph.D.

Senior Project Manager, Transportation
